

Task A-B

 0 sec.  0 MB

Find the difference of two numbers.

Input

The first line of the input file contains a and b .

Output

On the first line of the output file print one number – $a - b$.

Constraints

- $0 \leq a, b \leq 10^{18}$

Uploading the output files

The name of the output file for the test with number xx must be
test.xx.out

For tests from 1 to 9 the number is written with a leading zero. For example, the output for the eighth test must be in the file test.08.out, and the output for the tenth – in the file test.10.out.

You upload to the system a ZIP archive which contains at least one output file. The output files must be located directly in the archive, and not in a subdirectory. Files with other names are ignored. If a file for a given test is missing from the archive, this upload does not change your result for that test.

Every upload of an archive counts as one submission, regardless of how many output files the archive contains. If you upload outputs for the same test in more than one submission, the best result you have achieved on that test is taken for the final standing. An invalid output gives 0 points for the respective test, but has no effect if you have better results for the same test from a previous submission.
